

 Will be reviewed

8. What is an HTTP cookie used for? *

- ☐ Like dessert, cookies are used at the end of a transaction, to indicate the end of the transaction
- ☒ A cookies is a code used by a server, carried on a client's HTTP request, to access information the server had earlier stored about an earlier interaction with this person. [Think about the distinction between a browser and a person.]
- ☐ A cookie is a code used by a server, carried on a client's HTTP request, to access information the server had earlier stored about an earlier interaction with this Web browser. [Think about the distinction between a browser and a person.]
- ☐ A cookie is a code used by a client to authenticate a person's identity to an HTTP server.

 Will be reviewed

9. an IPv4 datagram has a *

- ☐ 4-byte header
- ☐ 8-byte header
- ☐ 20-byte header
- ☒ 20+ byte header

 Will be reviewed

10. Which of the characteristics below are associated with a client-server approach to structuring network applications (as opposed to a P2P approach) *

- ☐ A process requests service from those it contacts and will provide service to processes that contact it.
- ☒ There is a server with a well known server IP address.

- ☐ There is not a server that is always on
- ☐ None of the above

 **Will be reviewed**

11. Transfer of a bit into and out of a transmission media *

- ☐ Application Layer
- ☐ Transport layer
- ☐ Network layer
- ☒ Physical layer

 **Will be reviewed**

12. What specifies the format of packets that are sent and received among routers and end systems *

- ☐ TCP
- ☐ UDP
- ☒ IP
- ☐ DNS

 **Will be reviewed**

13. Which of the following descriptions below correspond to a "services" view of the Internet? *

- ☒ A platform for building network applications
- ☐ A collection of billions of computing devices, and packet switches interconnected by links

☐ A "network of networks".

☐ A collection of hardware and software components executing protocols that define the format and the order of messages exchanged between two or more communicating entities, as well as the actions taken on the transmission and/or receipt of a message or other event.

 **Will be reviewed**

14. Match the function of a server to a given type of DNS server in the DNS server hierarchy.
Replies to DNS query by local host, by contacting other DNS servers to answer the query. *

☒ Local DNS server

☐ Authoritative DNS server

☐ DNS root servers

☐ Top Level Domain (TLD) servers

 **Will be reviewed**

15. Time spent transmitting packets bits into the link *

☐ Processing delay

☐ Propagation delay

☒ Transmission delay

☐ Queueing delay

 **Will be reviewed**

16. Which of the following are changes between HTTP 1.1 and HTTP/2? *

☐ HTTP/2 allows a large object to be broken down into smaller pieces, and the transmission of those pieces to be interleaved with transmission other smaller objects, thus preventing a large object from forcing many smaller objects to wait their turn for transmission.

- ☐ HTTP/2 provides enhanced security by using transport layer security (TLS).
- ☐ HTTP/2 has many new HTTP methods and status codes.
- ☒ All of the above

 **Will be reviewed**

17. Match the name of an Internet layer with unit of data that is exchanged among protocol entities at that layer, Application layer *

- ☐ Datagram
- ☒ Message
- ☐ Bit
- ☐ Segment

 **Will be reviewed**

18. Forwarding is the local action of moving arriving packets from router's input link to appropriate router output link, while routing is the global action of determining the source-destination paths taken by packets. *

- ☒ True
- ☐ False

 **Will be reviewed**

19. When an application uses a UDP socket, what transport services are provided to the application by UDP? *

- ☐ Throughput guarantee. The socket can be configured to provide a minimum throughput guarantee between sender and receiver.

- ☐ Congestion control. The service will control senders so that the senders do not collectively send more data than links in the network can handle.
- ☒ Best effort service. The service will make a best effort to deliver data to the destination but makes no guarantees that any particular segment of data will actually get there.
- ☐ Flow Control. The provided service will ensure that the sender does not send so fast as to overflow receiver buffers.

 **Will be reviewed**

20. What is the purpose of a cookie value in the HTTP GET request? *

- ☒ The cookie value encodes a default set of preferences that the user has previously specified for this web site
- ☐ The cookie value encodes the format of the reply preferred by the client in the response to this GET request
- ☐ The cookie value itself doesn't mean anything. It is just a value that was returned by a web server to this client during an earlier interaction
- ☐ The cookie value indicates whether the user wants to use HTTP/1, HTTP/1.1, or HTTP/2 for this GET request.

 **Will be reviewed**

21. What is the purpose of the HTTP GET message? *

- ☐ The HTTP GET request message is sent by a web server to a web client to get the identity of the web client.
- ☐ The HTTP GET request message is sent by a web server to a web client to get the next request from the web client.
- ☒ The HTTP GET request message is used by a web client to request a web server to send the requested object from the server to the client.
- ☐ The HTTP GET request message is used by a web client to post an object on a web server.

 **Will be reviewed**

22. Which of the fields below are in a UDP segment header *

- ☒ Internet checksum
- ☐ Upper layer protocol
- ☐ Data (payload)
- ☐ Sequence number

 **Will be reviewed**

23. Time spent waiting in packet buffers for link transmission *

- ☐ Processing delay
- ☐ Propagation delay
- ☐ Transmission delay
- ☒ Queueing delay

 **Will be reviewed**

24. What do we mean when we say “HTTP is stateless”? In answering this question, assume that cookies are not used *

- ☐ The HTTP protocol is not licensed in any country.
- ☐ An HTTP client does not remember anything about what happened during earlier steps in interacting with any HTTP server.
- ☒ An HTTP server does not remember anything about what happened during earlier steps in interacting with this HTTP client

- ☐ An HTTP client does not remember the identities of the servers with which it has interacted.

 **Will be reviewed**

25. What is the purpose of the HTTP GET message? *

- ☐ The HTTP GET request message is sent by a web server to a web client to get the identity of the web client.
- ☐ The HTTP GET request message is sent by a web server to a web client to get the next request from the web client.
- ☒ The HTTP GET request message is used by a web client to request a web server to send the requested object from the server to the client.
- ☐ The HTTP GET request message is used by a web client to post an object on a web server.

 **Will be reviewed**

26. Time spent waiting in packet buffers for link transmission *

- ☐ Processing delay
- ☐ Propagation delay
- ☐ Transmission delay
- ☒ Queueing delay

 **Will be reviewed**

27. Which of the characteristics below are associated with the technique of circuit switching? *

- ☐ This technique is used in the Internet
- ☐ Congestion loss and variable end-end delays are possible with this technique
- ☐ Resources are used on demand, not reserved in advance

- ☒ Frequency Division Multiplexing (FDM) and Time Division Multiplexing (TDM) are two approaches for implementing this technique

 **Will be reviewed**

28. When we say that the Internet is a “network of networks,” we mean? *

- ☐ The Internet is the largest network ever built
- ☐ The Internet is made up of a lot of different networks that are interconnected to each other
- ☐ *The Internet is the fastest network ever built*
- ☒ All of the above

 **Will be reviewed**

29. What is the purpose of the conditional HTTP GET request message? *

- ☐ To allow a server to only send the requested object to the client if the server is not overloaded.
- ☒ To allow a server to only send the requested object to the client if this object has changed since the server last sent this object to the client
- ☐ To allow a server to only send the requested object to the client if the client is authorized to receive that object.
- ☐ To allow a server to only send the requested object to the client if the client has never requested that object before

 **Will be reviewed**

30. Time need for bits to physically propagate through the transmission medium from end one of a link to the other *

- ☐ Processing delay
- ☒ Propagation delay

☐ Transmission delay

☐ Queueing delay

 **Will be reviewed**

31. Match the name of an Internet layer with unit of data that is exchanged among protocol entities at that layer, Link layer *

☐ Datagram

☐ Message

☐ Segment

☒ Frame

 **Will be reviewed**

32. Match the name of an Internet layer with unit of data that is exchanged among protocol entities at that layer, Transport layer *

☐ Datagram

☐ Message

☐ Bit

☒ Segment

 **Will be reviewed**

33. What is the purpose of the conditional HTTP GET request message? *

☐ To allow a server to only send the requested object to the client if the server is not overloaded.

☒ To allow a server to only send the requested object to the client if this object has changed since the server last sent this object to the client.

- ☐ To allow a server to only send the requested object to the client if the client is authorized to receive that object.
- ☐ To allow a server to only send the requested object to the client if the client has never requested that object before

 **Will be reviewed**

34. Delivery of datagrams from a source host to a destination host (typically) *

- ☐ Link layer
- ☐ Application Layer
- ☐ Transport layer
- ☒ Network layer

 **Will be reviewed**

35. Which of the characteristics below are associated with the technique of packet switching? *

- ☐ Frequency Division Multiplexing (FDM) and Time Division Multiplexing (TDM) are two approaches for implementing this technique.
- ☒ This technique was the basis for the telephone call switching during the 20th century and into the beginning of this current century.
- ☐ Data may be queued before being transmitted due to other user's data that's also queueing for transmission.
- ☐ Reserves resources needed for a call from source to destination

 **Will be reviewed**

36. P2P networks do not need a server

*

☒ True

☐ False

 **Will be reviewed**

37. When an application uses a UDP socket, what transport services are provided to the application by UDP? *

☐ Throughput guarantee. The socket can be configured to provide a minimum throughput guarantee between sender and receiver.

☐ Congestion control. The service will control senders so that the senders do not collectively send more data than links in the network can handle.

☒ Best effort service. The service will make a best effort to deliver data to the destination but makes no guarantees that any particular segment of data will actually get there.

☐ Flow Control. The provided service will ensure that the sender does not send so fast as to overflow receiver buffers.

 **Will be reviewed**

38. Match the function of a server to a given type of DNS server in the DNS server hierarchy. Provides authoritative hostname to IP mappings for organization's named hosts. *

☐ Local DNS server

☒ Authoritative DNS server

☐ DNS root servers

☐ Top Level Domain (TLD) servers

 **Will be reviewed**

39. Transfer of data between one process and another process (typically on different hosts) *

- ☐ Link layer
- ☐ Application Layer
- ☒ Transport layer
- ☐ Network layer

 **Will be reviewed**

40. Which of the following descriptions below correspond to a "nuts-and-bolts" view of the Internet? *

- ☐ A platform for building network applications
- ☒ A "network of networks"
- ☐ A place I go for information, entertainment, and to communicate with people
- ☐ All of the above

 **Will be reviewed**

41. Where is transport-layer functionality primarily implemented *

- ☒ Transport layer functions are implemented primarily at the hosts at the "edge" of the network
- ☐ Transport layer functions are implemented primarily at the routers and switches in the network
- ☐ Transport layer functions are implemented primarily at each end of a physical link connecting one host/router/switch to another one host/router/switch
- ☐ None of the above

 **Will be reviewed**

42. Match the name of an Internet layer with unit of data that is exchanged among protocol entities at that layer, Network layer *

☒ Datagram

☐ Message

☐ Segment

☐ Frame

 **Will be reviewed**

43. UDP packet has *

☒ 2 byte header

☐ 8 byte header

☐ 12 byte header

☐ 16 byte header

 **Will be reviewed**

44. Which of the characteristics below are associated with a P2P approach to structuring network applications (as opposed to a client-server approach)? *

☐ There is a server that is always on

☐ HTTP uses this application structure

☐ There is a server with a well known server IP address

☒ There is not a server that is always on

 **Will be reviewed**

45. What is the purpose of a cookie value in the HTTP GET request? *

- ☒ The cookie value encodes a default set of preferences that the user has previously specified for this web site.
- ☐ The cookie value encodes the format of the reply preferred by the client in the response to this GET request.
- ☐ The cookie value itself doesn't mean anything. It is just a value that was returned by a web server to this client during an earlier interaction.
- ☐ The cookie value indicates whether the user wants to use HTTP/1, HTTP/1.1, or HTTP/2 for this GET request.

 **Will be reviewed**

46. Match the name of an Internet layer with unit of data that is exchanged among protocol entities at that layer, Physical layer *

- ☐ Datagram
- ☐ Message
- ☒ Bit
- ☐ Segment

 **Will be reviewed**

47. Match the function of a server to a given type of DNS server in the DNS server hierarchy. Responsible for a domain (e.g., *.com, *.edu); knows how to contact authoritative name servers *

- ☐ Local DNS server
- ☐ Authoritative DNS server
- ☐ DNS root servers
- ☒ Top Level Domain (TLD) servers

 Will be reviewed

48. Which of the definitions below describe what is meant by the term "encapsulation"? *

- ☐ Determining the name of the destination host, translating that name to an IP address and then placing that value in a packet header field.
- ☐ Starting a transport layer timer for a transmitted segment, and then if an ACK segment isn't received before the timeout, placing that segment in a retransmission queue.
- ☒ Taking data from the layer above, adding header fields appropriate for this layer, and then placing the data in the payload field of the "packet" for that layer.
- ☐ Receiving a "packet" from the layer below, extracting the payload field, and after some internal actions possibly delivering that payload to an upper layer protocol.

 Will be reviewed

49. Match the function of a server to a given type of DNS server in the DNS server hierarchy. Highest level of the DNS hierarchy, knows how to reach servers responsible for a given domain (e.g., *.com, *.edu) *

- ☐ Local DNS server
- ☐ Authoritative DNS server
- ☒ DNS root servers
- ☐ Top Level Domain (TLD) servers

 Will be reviewed

50. Which of the characteristics below are associated with a client-server approach to structuring network applications (as opposed to a P2P approach) *

- ☐ A process requests service from those it contacts and will provide service to processes that contact it.
- ☒ There is a server with a well known server IP address

- ☐ There is not a server that is always on
- ☐ All of the above

 **Will be reviewed**

51. Transfer of data between neighboring network devices *

- ☒ Link layer
- ☐ Application Layer
- ☐ Transport layer
- ☐ Network layer

 **Will be reviewed**

52. When there is not enough memory to buffer an incoming packet, a decision must be made to either drop the arriving packet (a policy known as **drop-tail**) or remove one or more already-queued packets to make room for the newly arrived packet. *

- ☒ True
- ☐ False

 **Will be reviewed**

53. Time needed to perform an integrity check, lookup packet information in a local table and move the packet from an input link to an output link in a router. *

- ☒ Processing delay
- ☐ Propagation delay
- ☐ Transmission delay

☐ Queueing delay

 **Will be reviewed**

54. Protocols that are part of a distributed network application *

- ☐ Link layer
- ☐ Application Layer
- ☐ Transport layer
- ☒ Network layer

 **Will be reviewed**

55. Which of the following physical layer technologies has the highest transmission rate and lowest bit error rate in practice? *

- ☐ Twisted pair (e.g., CAT5, CAT6)
- ☐ Coaxial cable
- ☐ Satellite channel
- ☒ Fiber optic cable

 **Will be reviewed**

56. When an application uses a TCP socket, what transport services are provided to the application by TCP? *

- ☐ Throughput guarantee. The socket can be configured to provide a minimum throughput guarantee between sender and receiver.
- ☐ Real-time delivery. The service will guarantee that data will be delivered to the receiver within a specified time bound.

- ☒ Congestion control. The service will control senders so that the senders do not collectively send more data than links in the network can handle
- ☐ Best effort service. The service will make a best effort to deliver data to the destination but makes no guarantees that any particular segment of data will actually get there.

 **Will be reviewed**

57. When an application uses a TCP socket, what transport services are provided to the application by TCP? *

- ☐ Throughput guarantee. The socket can be configured to provide a minimum throughput guarantee between sender and receiver.
- ☐ Real-time delivery. The service will guarantee that data will be delivered to the receiver within a specified time bound.
- ☒ Congestion control. The service will control senders so that the senders do not collectively send more data than links in the network can handle.
- ☐ Best effort service. The service will make a best effort to deliver data to the destination but makes no guarantees that any particular segment of data will actually get there.
